

Imidazole Curing Agents for Epoxy Resins

Imidazoles are used primarily as accelerators in the reaction between epoxy resins and other curing agents. They can be used as the sole curing agent offering:

- Single package latency from several hours to greater than six months
- Rapid cure beyond activation temperatures
- High thermal and chemical resistance

Advantages

When used alone, imidazoles are some of the most efficient types of Lewis-Base catalysts. At use levels of less than 8 phr, they initiate anionic homopolymerization of the epoxy resin, creating highly cross-linked networks. Reaction activation temperatures in imidazoles are controlled by substitution with organic groups on the ring, chemically blocking active amine hydrogen on the ring and salt formation with ring nitrogen. These modifications create steric and/or resin

solubility effects, allowing the formulator to control latency. This is the key distinguishing feature of the imidazole family. Evonik imidazoles provide a broad range of latency.

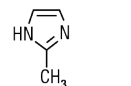

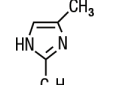

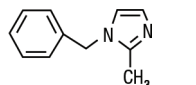

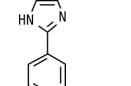

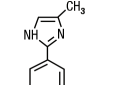

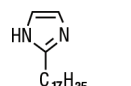

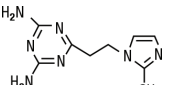

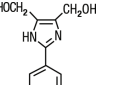

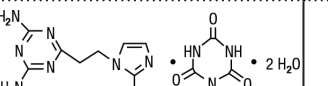

Reaction with imidazoles is rapid beyond activation temperatures and, unlike with other Lewis-Base catalysts, the degree of cure can be driven further with higher postbake temperatures. The chemical resistance of the finished product is similar to that of aromatic amine-cured resins; however, heat deflection

temperatures (HDT) can reach higher than 392°F/200°C. With silica flour or alumina filled formulations, HDT can approach 572°F/300°C.

Applications

- Casting, potting and encapsulation of electronic devices
- Electrical laminates
- Molding powders and powder coatings
- One-pack structural adhesives for automotive and aerospace uses
- Composites

Imidazole Curing Agents for Epoxy Resins

Imidazole	Chemical Structure	Molecular Weight	Appearance	Storage Life (years)	Melting Point °F/°C	Rec PHR	Solubility in Liquid Epoxy @ °F/°C	Pot Life ¹
Imicure® AMI-2		82	Pale yellow powder	2	279–293 137–145	1–4	> 266 > 130	3.5 hr

Curezol 2MA-OK		384	White powder	3	482 250	5	> 248 > 120	6–12 mon

(1) With liquid epoxy resin (EEW = 190)

(2) Time required for 200g mass to gel

(3) Time required for < 0.5g mass to gel on hot plate

(4) Glass transition temperature by Thermal Mechanical Analysis (TMA)

(5) Decomposes releasing formaldehyde above MP 6

(6) Heat deflection temperature (HDT) to ASTM D648 at 264 psi after curing 7 days at 25°C only for room temperature curing systems. Longer cure times and particularly higher temperature post-cures yield much higher values. Results given for elevated-temperature (ET) curing systems are based on various ET cure schedules.

Imidazole Curing Agents for Epoxy Resins

Imidazole	Gel Time ^{1,2} 70°C	Gel Time ^{1,2} 100°C	Gel Time ^{1,2} 150°C	Typical Cure Schedule ¹	Glass Transition Temp, °F/°C	Comments/Applications
Imicure® AMI-2	20 min	2 min	—	1.5 hr @ 176°F/80°C + 4 hr @ 302°F/150°C	—	Accelerator for dicyandiamide, anhydride and phenolic curing agents used in electrical laminates, powder coatings, molding powders and structural adhesives.
Curezol* 2E4MZ	33 min	4 min	70 sec	1.5 hr @ 176°F/80°C + 4 hr @ 302°F/150°C	313 ⁶ 156	Accelerator for dicyandiamide, anhydride and phenolic curing agents in filament winding, electrical laminates, powder coatings, molding powders and structural adhesives. When used as a curing agent, post cures of 200 °C in silica flour filled formulations produce heat deflection temperatures of 200–300 °C.
Curezol 1B2MZ	27 min	5 min	35 min	1.5 hr @ 176°F/80°C + 4 hr @ 302°F/150°C	310 ⁶ 154	Low-viscosity accelerator for anhydride curing agents used in casting, potting and encapsulation in electrical and electronic applications.
Curezol 2PZ	—	17 min	80 sec	1.3 hr @ 176°F/80°C + 4 hr @ 302°F/150°C	316 ⁶ 158	Accelerator for dicyandiamide, anhydride and phenolic curing agents used in electrical laminates, molding compounds and potting compounds.
Curezol 2P4MZ	NA	NA	4 min	1.5 hr @ 176°F/80°C + 4 hr @ 302°F/150°C	309 ⁶	Accelerator for dicyandiamide, anhydride and phenolic curing agents. Used in solder mask inks, adhesives and electronic molding compound applications.
Curezol C17Z	17.5 hr	13 min	4 min	1.5 hr @ 176°F/80°C + 4 hr @ 302°F/150°C	312 ⁶ 156	Accelerator for dicyandiamide, anhydride and phenolic curing agents. Offers good latency with rapid reaction at elevated temperatures. Used in structural adhesives, molding powders, powder coatings and structural laminates.
Curezol 2MZ Azine	10 hr	30 min	90 sec	2 hr @ 212°F/100°C + 4 hr @ 302°F/150°C	313 ⁶ 156	Accelerator for dicyandiamide and anhydride curing agents. Used in electronic applications such as solder-resistant inks and insulating powders as well as structural adhesives.
Curezol 2PHZ-PW	—	—	400–550 sec	2 hr @ 212°F/100°C + 4 hr @ 302°F/150°C	374 ⁶ 190	A substituted imidazole that can be used as an epoxy curing agent or as an accelerator for dicyandiamide or anhydride curing agents in a wide variety of applications including electric and electronic parts, paints, adhesives, and construction composite materials.
Curezol 2MA-OK	—	108 min	100 sec	2 hr @ 212°F/100°C + 4 hr @ 302°F/150°C	293 145	Accelerator for dicyandiamide, anhydride and phenolic curing agents. Best combination of latency and low-temperature cure. Must be compounded at < 40°C to keep water of crystallization and to maintain latency. Used in electrical and electronic insulation and solder resists.
